Management Report: Employee & Project Profitability (Jul–Sep 2026)

Oct 27, 2026 · @Muhammad Shafayat Hossain

Executive summary

All five projects are profitable: $142,500 revenue and $36,431 cost gave **$106,069 profit (74.4% margin)** over July–September 2026. The real risk is how people are used, not which projects are taken on.

- **Briclab earns the most** ($27,488 profit); **ShopEase earns the least per hour worked** ($33 vs $55 for MediCore).
- **Two engineers are overloaded:** Amina Rahman (131%) and Tanvir Hasan (125%) staff both Briclab and LearnLoop alone.
- **Six people have spare capacity:** about **$8,450 of salary (23% of payroll)** paid for hours not logged on any project.
- Labor is 85% of all cost, so staffing decisions move profit far more than cutting expenses.

1. Which projects generate the most profit?

Briclab and MediCore lead on profit; ShopEase has the lowest margin and the lowest revenue per hour, despite using the most hours.

Project	Client	Revenue ($)	Labor cost ($)	Other cost ($)	Profit ($)	Margin	Hours	Revenue per hour ($)
Briclab	Northstar Ltd	36,000	7,172	1,340	27,488	76.4%	690	52.2
MediCore	HealthBridge	33,000	5,967	1,520	25,513	77.3%	600	55.0
FinTrack	Delta Finance	28,500	5,766	810	21,924	76.9%	630	45.2
ShopEase	RetailWorks	24,000	6,666	990	16,344	68.1%	720	33.3
LearnLoop	EduSpark	21,000	5,541	660	14,799	70.5%	540	38.9
Total		**142,500**	**31,111**	**5,320**	**106,069**	**74.4%**	**3,180**	**44.8**

Revenue per hour shows how well a project's price matches the effort it takes. ShopEase earns $33 per hour of work, 40% less than MediCore.

2. Which projects have the highest utilization and cost?

ShopEase uses the most hours (720) and Briclab has the highest labor cost ($7,172). Team utilization averages 82.8%, but it is very uneven between people.

Employee	Department	Projects	Hours (3 months)	Utilization
Amina Rahman	Engineering	Briclab, LearnLoop	630	131%
Tanvir Hasan	Engineering	Briclab, LearnLoop	600	125%
Sajid Karim	Engineering	ShopEase	405	84%
Rakib Ahmed	Engineering	FinTrack	345	72%
Farhana Akter	QA	ShopEase	315	66%
Mehedi Chowdhury	Project Management	MediCore	315	66%
Nadia Islam	Design	FinTrack	285	59%
Jannat Sultana	QA	MediCore	285	59%

Utilization = hours logged ÷ 480 standard hours (160 per month × 3).

- Briclab and LearnLoop are run by the same two engineers, with no QA or design support. Amina and Tanvir worked 270 hours above standard capacity, a burnout and delivery risk for the most profitable project.
- Every other project has two people, and most of them have spare hours.

Where money is being wasted

The biggest loss is paid time not spent on client work: about $8,450 over three months, more than all software and hosting costs combined ($5,320).

Employee	Spare hours	Salary paid for spare hours ($)
Mehedi Chowdhury	165	1,959
Nadia Islam	195	1,584
Jannat Sultana	195	1,523
Rakib Ahmed	135	1,350
Farhana Akter	165	1,238
Sajid Karim	75	797
Total	**930**	**8,452**

- **ShopEase is under-priced for its effort.** It takes the most hours but earns the least per hour ($33).
- **Software subscriptions cost $2,550.** MediCore alone spends $1,010 (40% of the total), more than any other project.
- Some spare hours may be work that was done but not logged: Mehedi, the only project manager, records time on MediCore only.

3. Recommendations for management

Most of the gain comes from moving existing people, which costs nothing extra because staff are salaried.

1. **Rebalance engineering work.** Move about 210 hours of LearnLoop engineering from Amina and Tanvir to Rakib (135 spare hours) and Sajid (75 spare hours). This brings both overloaded engineers close to 100% and protects Briclab, the top earner.
2. **Add QA and design to Briclab and LearnLoop.** Assign Jannat and Farhana (QA) and Nadia (design) to these projects. This takes testing and design off the engineers and puts about $4,300 of idle salary to use.
3. **Reprice or rescope ShopEase at renewal.** Matching the team average of $44.8 per hour would mean about $10,750 per month instead of $8,000. If the client will not pay more, reduce the hours spent.
4. **Audit software subscriptions, starting with MediCore.** Cancel unused licences and share tools across projects.

5. **Tighten timesheets.** Allow only valid project codes, block negative or blank hours, approve entries before month end, and ask the project manager to log time on every project he supports.

Data and method notes

- **Sources:** employees, projects, timesheets and expenses files for July–September 2026 (8 employees, 5 projects).
- **Revenue** = monthly contract revenue × 3 months. **Labor cost** = hours logged × hourly rate, where hourly rate = monthly salary ÷ 160.
- **Excluded records:** 5 timesheet entries (negative hours, a blank entry, an unknown employee with pending approval, an unknown project) and 1 expense charged to an unknown project.
- **Name fix:** the project list said “Bricly” while timesheets and expenses said “Briclab”; “Briclab” is used throughout.
- **Limitation:** overtime is valued at the normal hourly rate. Using the full payroll of $36,750 instead, profit is $100,430 (70.5% margin); the conclusions do not change.
